

I was alone in my group. I really enjoyed working with Triton AI. There are a lot of smart and kind students who I met. There are undergraduate students, masters students, and PHD students in addition to Professor Jack who runs the organization. My experience was good overall with Jack as a mentor. He tended to be very hands off and just give me a task and only come to him with progress updates where we could explain any issues we were having. I did not have as much time with Jack as I would have liked but he is very busy and I was ill for a huge part of the quarter. I truly hope he believes I contributed to him and the organization as I do. It was awesome to be able to have access to all the technology and resources available to Triton AI. I worked with an undergraduate named Alexei Davis for the first part of my project on the Atlas. He is in Jack's project class and was a pleasure to work with. He ended up going to Purdue for the race so I'm glad both of our hard work was on display there and he got to see the kart actually racing. I don't have to much else to say about Jack and Triton AI other than that they were very welcoming to me and are truly doing groundbreaking work.
